**Clinical History:** A five-year-old, spayed female, American Domestic Shorthair Cat had a two-year history of multifocal non-healing ulcerated areas with serous discharge on the ventral abdomen (Fig. 1) that responded partially to antibiotics and steroids. The lesions were biopsied and submitted for culture and histopathology.

#### **Clinical Images:**

## **Histological Images:**

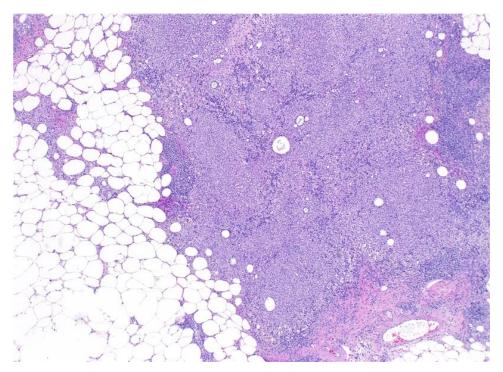

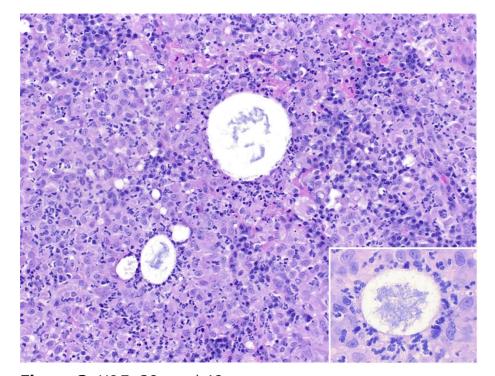

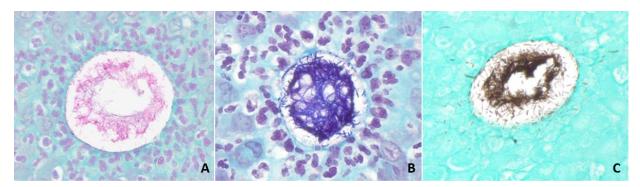

Figure 2. Hematoxylin and eosin stain (H&E), 10x.

**Figure 3.** H&E, 20x and 40x.

**Figure 4. A.** Fite's-Faraco acid-fast stain **B.** Gram stain **C.** Grocott Methenamine Silver (GMS) stain; 40x.

### Follow-up questions:

- 1. Morphologic diagnosis?
- 2. Etiological diagnosis?
- 3. Condition?
- 4. Possible causative agent(s)?

\*The Diagnostic Exercises are an initiative of the Latin Comparative Pathology Group (LCPG), the Latin American subdivision of The Davis-Thompson Foundation. These exercises are contributed by members and non-members from any country of residence. - Consider submitting an exercise! - A final document containing this material with answers and a brief discussion will be posted on the CL Davis website.
